THE PHASES OF THE MOON

The moon circles the earth at a distance of 384,405 km and its diameter is 3,476 km.

The moon's volume is 50 times less than of the earth. The gravitational pull is significantly less than that of the earth and all weights on the moon are 6 times lighter. The temperature of the moon's surface during the exposure to sunlight is 130° Celsius, while during the moonlight night which lasts two weeks is -158° Celsius. It takes the moon 29 days, 12 hours, 44 minutes and 2.8 seconds to circle the globe.

The moon always shows the earth the same face. It rotates once around its own axis during this revolution.
